Software for research comes in many different forms and technologies. This includes software that runs on mobile devices. The demand for this is growing, whether it is for “citizen-science” projects or in clinical and educational research. In this SORSE (online) roundtable event, we discuss \* examples of mobile apps for research \* what are the challenges for mobile apps in and for research. In particular: \* logistic of deploying and delivering mobile apps \* maintenance costs \* distribution of apps - what are the options \* how to build the right team for mobile apps development \* what technology stacks are used in mobile app development. And what determines the choice? Note: this event will be recorded for a podcast.

### Panelists

- Adrian Harwood, University of Manchester, leads mobile development efforts in his RSE group.
- Peter Schmidt, University College London, has been an app developer in the private sector and now at UCL.
- Mark Turner, University of Newcastle, leads mobile development efforts in his RSE group.
